Title : The Effect of Stimulation of Gastric Enteroceptors upon Salivary Gland Activity in Cancer and in Precancerous Diseases of the Stomach.

Orig Pub : Tr. In-ta experim. med. AN Latv SSR, 1956, 10, 45-58

Abstract : When gastric mechanoreceptors of the majority of control patients were stimulated, there was normal salivary secretion. In cancer patients and in those with precancerous lesions the inert and inhibitory types of salivary secretion predominated; during the late stages of the disease there was no response. In cases of gastric ulcers an "excitable" type of salivary secretion predominated.

AUTHOR: Erdödy, István, Aspirant

TITLE: Measuring instruments for gas turbine research in the Soviet Union. I

PERIODICAL: Energia és atomtechnika, no. 3, 1962, 97-103

TEXT: The problems of measurement are listed and it is pointed out that one of the greatest difficulties arises when measurements are made at or above the velocity of sound. At these velocities the pressure waves formed on the probes, distort the pattern of flow. Conventional instruments do not give accurate results in this region. After discussing the great importance of improving the efficiency of turbines, the author describes the experimental results obtained with some instruments used in research establishments in the Soviet Union. Various establishments use different principles in their research. Ram pressure measuring instruments are considered first. The simplest one is the Pitot tube,

Card 1/2

but due to its geometry, a velocity dependent correction factor has to be introduced. Also the tube must be in parallel with the flow. Often the velocity pattern is not uniform (turbulent flow), and hence the right positioning of the instrument cannot be determined. To obtain accurate results under these conditions instruments of reduced sensitivity are required. The sensitivity of the tube depends on the shape of its head. This relationship is illustrated. Instruments with double tube pressure absorber instruments and those with side apertures are also considered. The last part of the article deals with the static pressure gauges, and shows that conventional Prandtl tubes introduce a considerable error at λ = 0.95-1.15. By pointed formation of the head the error in measurement is reduced to about 0.5% up to λ = 1.2. Smaller instruments have also been developed. In two dimensional static flow the disc shaped pressure gauges proved satisfactory. There are 24 figures.

TITLE: Phenomena in the turbine blade systems and the correct forming of the profile

PERIODICAL: Energia és Atomtechnika, no. 8, 1962, 337 - 342

TEXT: After criticizing the incorrect practice of designing blades of constant setting angle and of constant cross section, the author considers the following three points from an aerodynamical point of view: 1) The deformation of the radial velocity triangle from the optimum condition. 2) The change in the pressure distribution due to the centrifugal force resulting from the rotation of the gas flow. 3) The leak through the inevitable gap between the stationary part and the rotor. In connection with point (3) the experiments of Anderguba are mentioned. The measurements carried out on the Bryansk turbine at the Bryansk Polytechnic to determine the loss of efficiency are also discussed. The article is to be continued. There are 15 figures.

Title : Diffusion Coefficients of Phenol in Water.

Orig Pub: Chem. listy, 1957, 51, No 9, 1618 - 1624.

Abstract: The diffusion coefficients of phenol in water was investigated on a stokes device with diaphragm in a concentration range of 1 - 15 grams per liter and at 20 -50°C. The concentration of phenol was determined by the permanganate method. The values of the integral diffusion coefficient $\overline{D}$, D versus concentration (c), the temperature-dependence of D_o and λ were calculated by the least square

Title : Approximate Methods for the Determination of the Coefficient of Diffusion of Nonelectrolytes in Liquids
Orig Pub. : Chem Prumysl, 8, No 6, 281-287 (1958)

Abstract : Using more reliable literature data on the diffusion coefficients D, the authors have investigated the suitability of a number of correlation equations for the approximate calculation of D in solutions of nonelectrolytes of different degrees of polarization and containing components of different molecular dimensions. For the calculation of D in dil solutions, the authors recommend the utilization of the nomograms and equation developed by Wilke (C. R. Wilke and Pin Chang, Am Inst Chem Eng J, 1, 264 (1955)). For the calculation of D in more concentrated solutions, the authors propose formu-

Investigations with catalysts. XX. Catalytic hydrogenation and polymerization as competitive reactions. 2. Heterogeneous catalytic oxidation-reduction polymerization of acrylonitrile. Z. Csuros, I. Géczy, B. Zsuffa, and E. Erdos (Tech. Univ. Budapest, Hung.). *Makromol. Chem.* 27, 171-9(1958); cf. C.A. 52, 18700h.—The suitable selected conditions were found to reach a max. yield of 80% during the heterogeneous catalytic oxidation-reduction polymerization, and the mol. wts. of the products varied between 15,000 and 380,000 according to the exptl. conditions. The influence of the amt. of the heterogeneous catalysts, the initial concn. of the persulfate and of the monomers on the reaction was detd. Only the persulfates were found to be active among the peroxy compds., while of the heterogeneous catalysts only those were found to be effective contg. rare metal (Pd). The cation of the peroxy compd. exerted no specific effect on the reaction. Products of higher mol. wt. were formed in acid medium and of lower mol. wt. in alk. medium. The yield decreases at ph > 7. Investigations with catalysts. XXI. Catalytic hydrogenation and polymerization as competitive reactions. 3. Kinetics and mechanisms of the heterogeneous catalytic oxidation-reduction polymerization of acrylonitrile. Z. Csuros, I. Géczy, and B. Zsuffa (Tech. Univ. Budapest, Hung.). *Ibid*, 180-91.—Polymerization of acrylonitrile in aq. soln. and in H atm. with $K_2S_2O_8$ and Pd catalyst on $BaSO_4$ was investigated. The total rate of polymerization was shown to reach a max. with increasing monomer concn., and then decreases again, while the polymerization degree of acrylonitrile is increased when the reaction progresses. The gross rate of reaction is proportional to the sq. root of persulfate concn. A linear relationship exists between the sq. root of persulfate concn. and the reciprocal value of the polymerization degree, showing that the chain termination occurs by reaction of 2 macro radicals. No chain transfer was found to occur during the detn. of the chain transfer const. An induction period depending on the persulfate concn. was observed during reaction, and the gross rate of the reaction increases as a function of time. The polymerization was found to occur not on the surface of the catalyst but primarily within the soln., which was based on the detn. of the valid kinetic correlations for the oxidation-reduction polymerization systems. Relationship and kinetic curves are given. 27 references. Arthur Lyem
